PC Quick Start Instructions

Connecting Your Monitors

Your new PC has 1 or more graphics card installed in it depending on how many screens you need to support, each graphics card can connect multiple screens.

Your computer may have some graphics ports located at the top of the tower near to the USB and Audio ports, these are only enabled if you have selected the Intel UHD Graphics option (6 or 10 screen configurations only).

Note that the main graphics card is mounted half way down the back of your PC and the first port on the left is classed as the primary port. You should connect the screen you want to use as your main one into this.

All Bundle Customers

If you have purchased a bundle then all the cables and adapters (if required) to connect your screens will be packaged in with your stand.

Cable types may vary depending on the screens supplied however you simply need to connect up from the computer to either a HDMI, DVI, or DisplayPort on your screens using the cables and adapters (if needed) supplied by us.

Computer Only Purchases

For customers who purchased the PC only, your computer has a mix of HDMI and DisplayPort outputs which can be easily converted into any digital monitor port (HDMI, DVI, or DisplayPort) using cables and / or adapters.

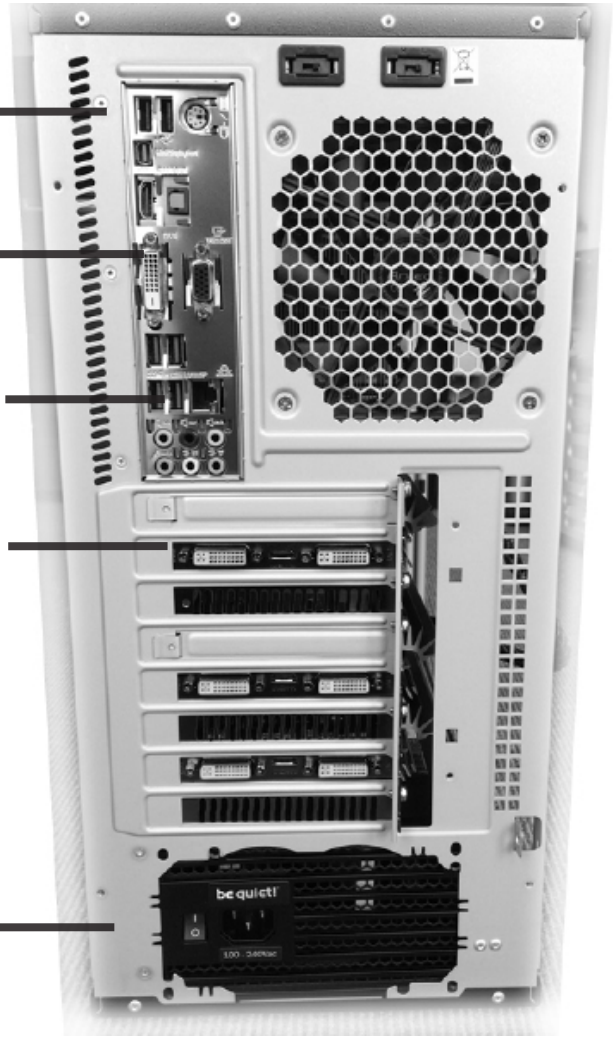
Connection Guide



PC Quick Start Instructions

Software

Your new computer has been fully installed with Microsoft Windows and has all the latest drivers and security updates applied, **you do not need to install Windows** on to the PC, it will boot up straight into your desktop screen.

Any disks and / or manuals supplied are for your future use / reference only.

There is one configuration step needed once you first boot into Windows, you will see a file on your desktop called 'Screen Setup Instructions' with full instructions and a link to a video showing the procedure.

Connecting Your Internet (LAN / Router / Wired)

Your PC has an 'ethernet' port on it which will accept a network cable from your Internet router, if possible we always suggest you use a wired connection over a wireless one as it offers faster and more stable performance.

Connecting Your Internet (WiFi / Wireless)

If you purchased a Wireless Network adapter with your new PC you may need to screw the (supplied) aerials onto the gold screw threads on the back of your PC. Alternatively please plug in your (supplied) WiFi USB card into a spare USB port.

Connecting Your Mouse / Keyboard

Customers with a wireless mouse and keyboard set need to connect the USB receiver into a USB port on the computer, this is included in the box with the mouse and keyboard set.
